<div align="center">

Client Meeting Notes
11/2/10
Team members in attendance: Kurt and Becca
Time: 2:30-3:00

</div>

Specification of data items/entities
- Entities – things that we have to store in the database such as variable names or field names
- Identify names for what we're searching for and the characteristics of the specific datum
- Example: Team_Name of data type text, # of characters
- Once we identify data entities, we can make ERD's (Entity Relationship Diagrams), comes later on

Mockups
- Client has templates we can use – **SEND E-MAIL**
- Picture of a person on a printout, same with a team (early screen layouts for information page); also the result page should be printable, for a report of the student, team, etc.
- Menu scheme – 3 main page menus
    1. Home
    2. 410
    3. 415

Scrollable region
- Should play around with this part to learn how to do it well
- What we come up with now doesn't have to look like final product
- Using anchors –> going to the server (with a PHP call) for date and make an anchor out of it –> learn the trick now

Database
- Team name
- Individual's first and last name (we have to decide how we want to store people's names)
- URL of things returned
    1. Home page – type text, which is URL
    2. Resume – type text, which is URL
    3. Picture – URL to picture

Any team member needing work hours can be put on this assignment by the client:
- Clean up the other team websites using WINSCP and SFTP
- Can do this from any computer to log time, and client can show members how to do this
- **SEND E-MAIL** about this

Miscellaneous
- For previous teams, perhaps we can clean up certain doc files on their sites so that the links are only to the PDF version.
