Section 7: Early Subsets and Implementation Priorities	66
Section 8: Foreseeable Modifications & Enhancements	67
Section 9: Acceptance Criteria	68
Section 10: Testing Requirements	69
Section 11: Design Hints and Guidelines	70
Section 12: Glossary of Terms	71

Section 1: Product Overview & Summary

The current tracking system being used by the Castleton Volunteer EMS Station for retirement benefits utilizes Microsoft Excel and has proven itself to be inefficient. It makes the viewing and editing of member information, activities, tours of duty and reports difficult to manage. Further, the current method for calculating retirement points for each EMS member is based simply on the use of Excels' ability to implement formulas. The formulas are then applied to make calculations based on data within the spreadsheet. This application of Excel creates limitations for the user due to the small frames of data that can be viewed at a time. To summarize, this system simply makes the handling of data much more difficult than needed.

Through the employment of a software package that works in conjunction with a Microsoft Access database, information will be easily accessible, data entry will be performed more efficiently, and point calculations will be an automated task provided by the system.

Section 2: Development, Operating, and Maintenance Environments

This system will be developed in cooperation with our client Dr. Timothy Lederman. The Length of Service Awards Program (LSAP) database program will be implemented through the implementation of C++ coding combined with a Microsoft Access database.

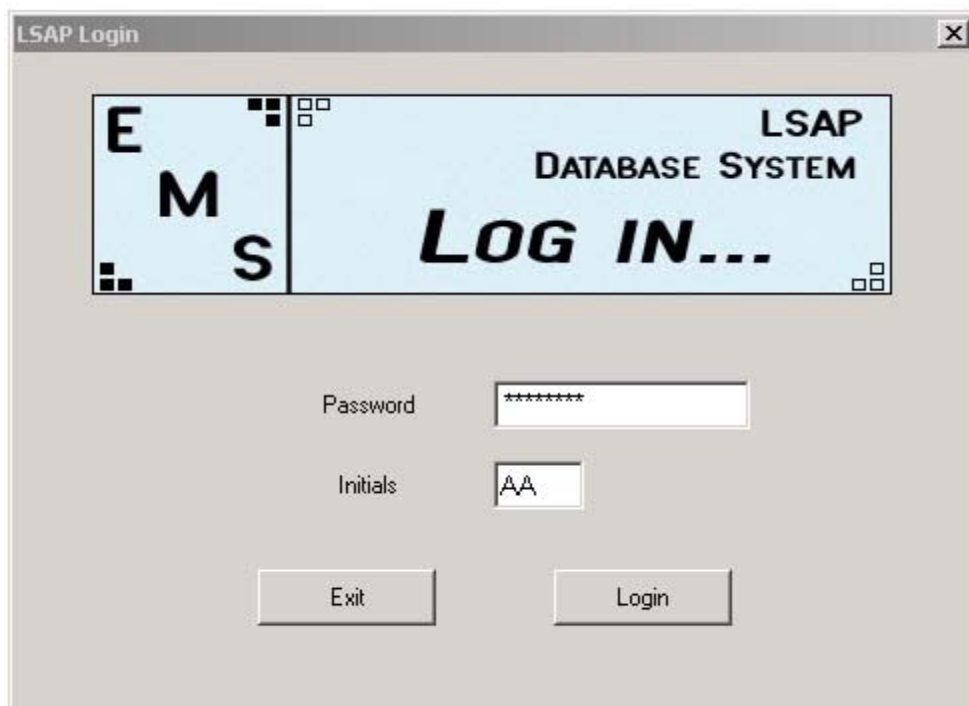

Operators of the LSAP system will interface with menus, forms and reports. These attributes of the system will be developed through the use of Microsoft Visual C++, the Microsoft Foundation Class (MFC) Library, and Microsoft Access.

FNA Technologies' highly trained software engineering staff and system maintenance personnel will perform maintenance of this database system. Maintenance will be conducted either onsite or within the FNA Technologies' labs, depending upon the nature of the problem.

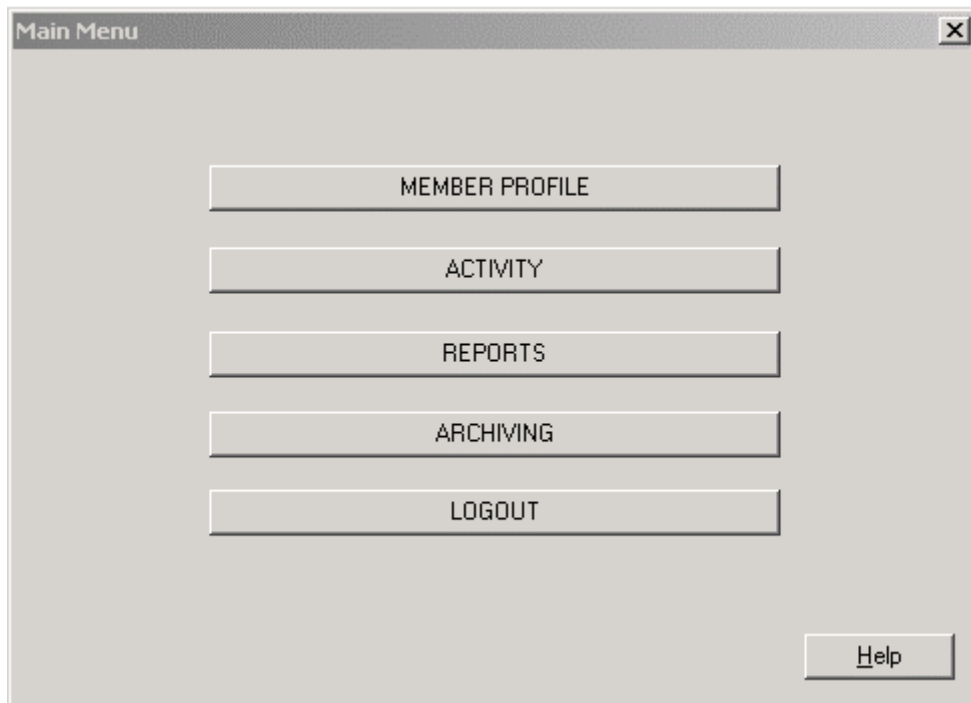

Section 3:
External Interfaces and Data Flows

Sample Screens

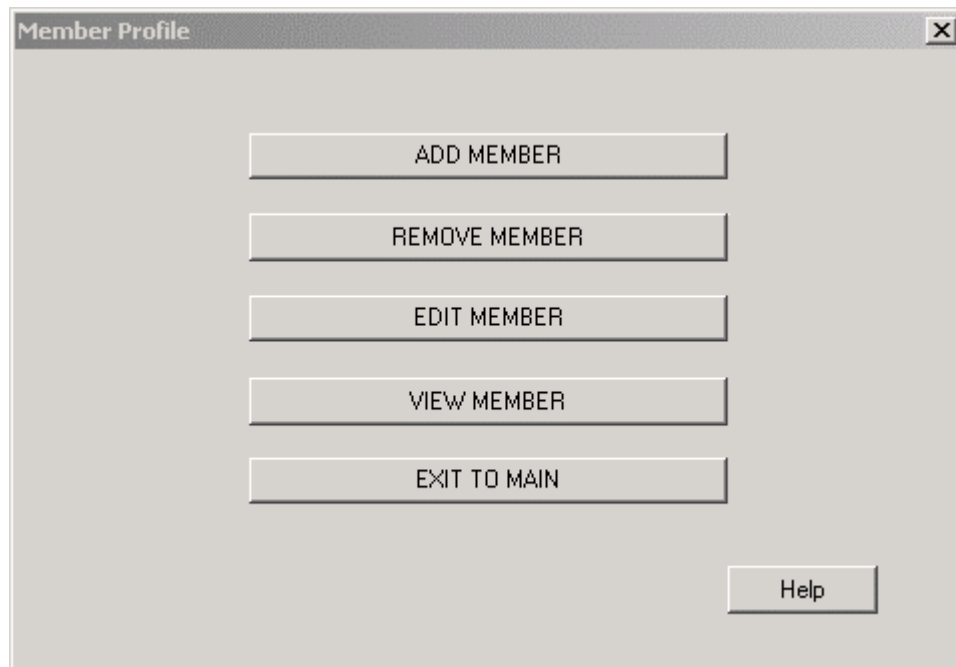

Login Screen:

Activity Form:

The image shows a software dialog box titled "Activity Form". On the left side, there is a list box labeled "Member Names" which is currently empty. To the right of the list box are several input fields: a dropdown menu for "Activity", a text box for "Title", a date field consisting of three separate boxes for day, month, and year, and a duration field with two boxes labeled "hr(s)" and "min(s)". Below these fields is a text area labeled "Comments". At the bottom of the dialog box, there are three buttons: "Help", "Cancel", and "Commit".

Duty Form:

The image shows a software window titled "Duty Form" with a close button (X) in the top right corner. The window is divided into two main sections. On the left, there are several input fields and buttons:

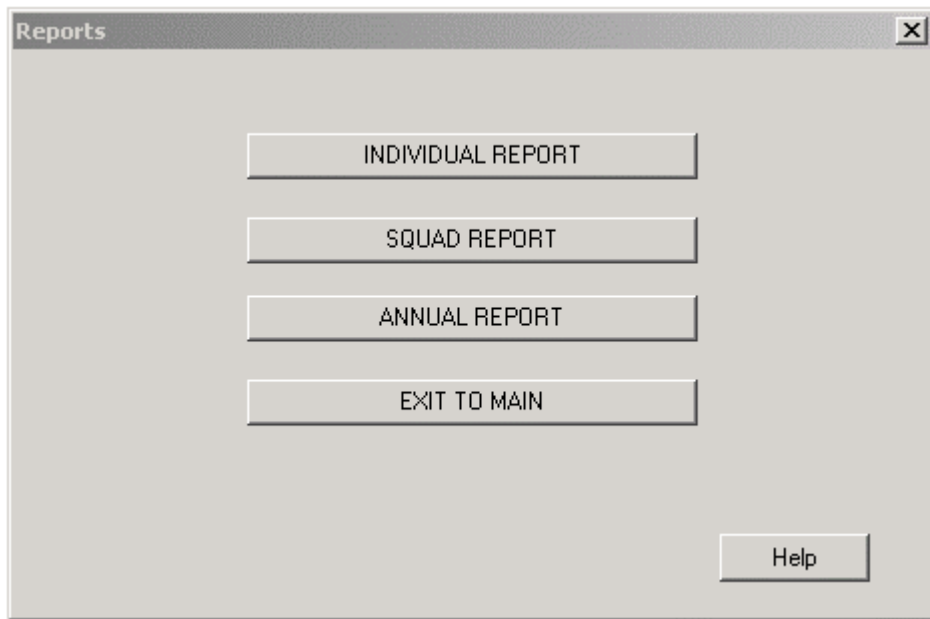

- Name:** A text input field with a dropdown arrow on the right.
- Year:** A text input field with a dropdown arrow on the right.
- Month:** A text input field with a dropdown arrow on the right.
- Day:** A text input field with a dropdown arrow on the right.
- Duration:** Two text input fields, the first followed by "hr(s)." and the second by "min(s)."
- Calls:** A text input field followed by "per month".

To the right of these fields are three buttons: "Add ->", "Remove <-", and "Update".

On the right side of the window is a large, empty rectangular area titled "Duty Log" at the top. It has a vertical scrollbar on its right edge.

At the bottom of the window are three buttons: "Help", "Cancel", and "Commit".

Reports:

Individual Report:

The screenshot shows a dialog box titled "Individual Report" with a close button (X) in the top right corner. The dialog contains the following elements:

- A "Name" label followed by a text input field with a dropdown arrow on the right.
- A "Report Type" label followed by two radio buttons: "Detailed" and "Summary".
- A "Year" radio button followed by a date selection field (month and year dropdowns).
- A "Month" radio button followed by a date selection field (month and year dropdowns).
- A "Date-to-Date" radio button followed by a date range selection field. The field is split into two rows: the top row has "DD", "MM", and "YYYY" labels with corresponding dropdowns; the bottom row has "To" centered above "DD", "MM", and "YYYY" labels with corresponding dropdowns.
- A "Complete History" radio button.
- At the bottom, three buttons: "Help", "Cancel", and "Gen. Report".

Squad Report:

Squad Report [X]

Name []

Report Type Detailed Summary

Year []

Month [] [] Year

Date-to-Date [] DD [] MM [] YYYY

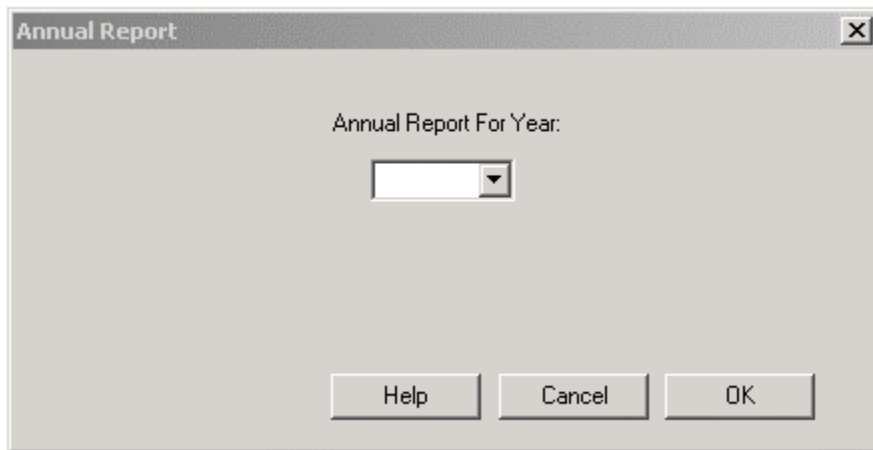

To

[] DD [] MM [] YYYY

Complete History

[Help] [Cancel] [Gen. Report]

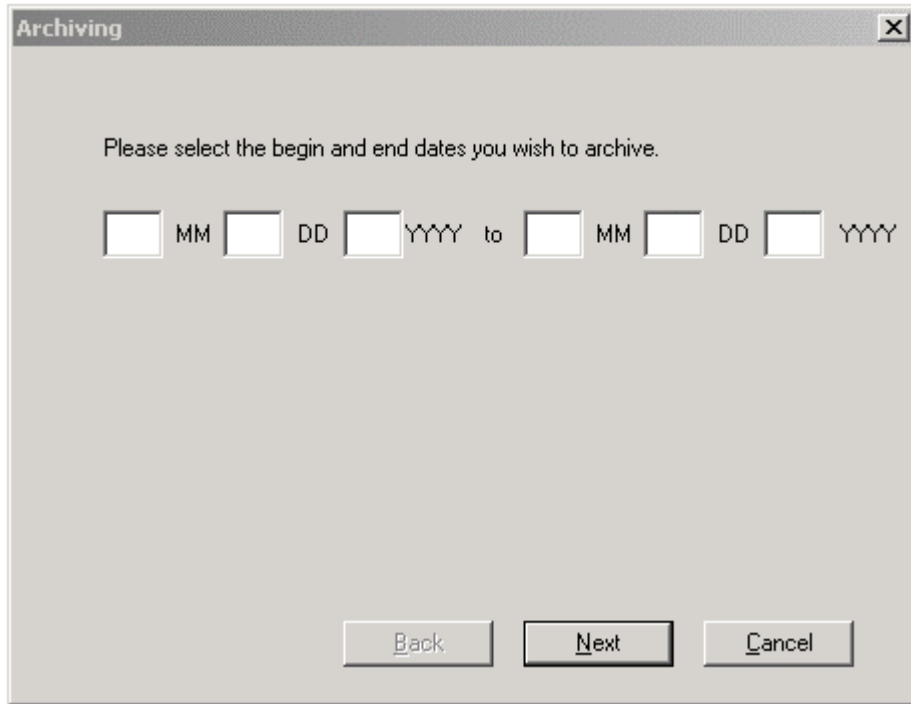

Annual Report:

The image shows a standard Windows-style dialog box titled "Annual Report". The dialog has a close button (X) in the top right corner. The main content area contains the text "Annual Report For Year:" followed by a dropdown menu. At the bottom of the dialog, there are three buttons: "Help", "Cancel", and "OK".

Archiving:

Step 1:

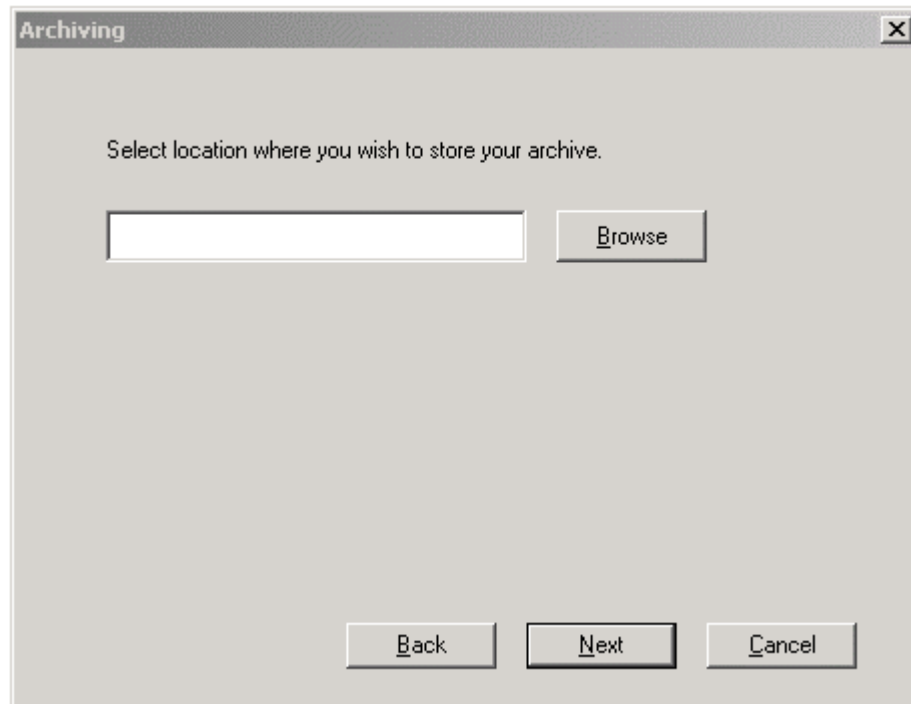

Archiving

Please select the begin and end dates you wish to archive.

MM DD YYYY to MM DD YYYY

This dialog box, titled "Archiving", contains a close button (X) in the top right corner. The main text asks the user to "Please select the begin and end dates you wish to archive." Below this text is a date selection interface consisting of two date fields separated by the word "to". Each date field is composed of three text input boxes: the first for the month (labeled "MM"), the second for the day (labeled "DD"), and the third for the year (labeled "YYYY"). At the bottom of the dialog, there are three buttons: "Back", "Next", and "Cancel".

Step 2:

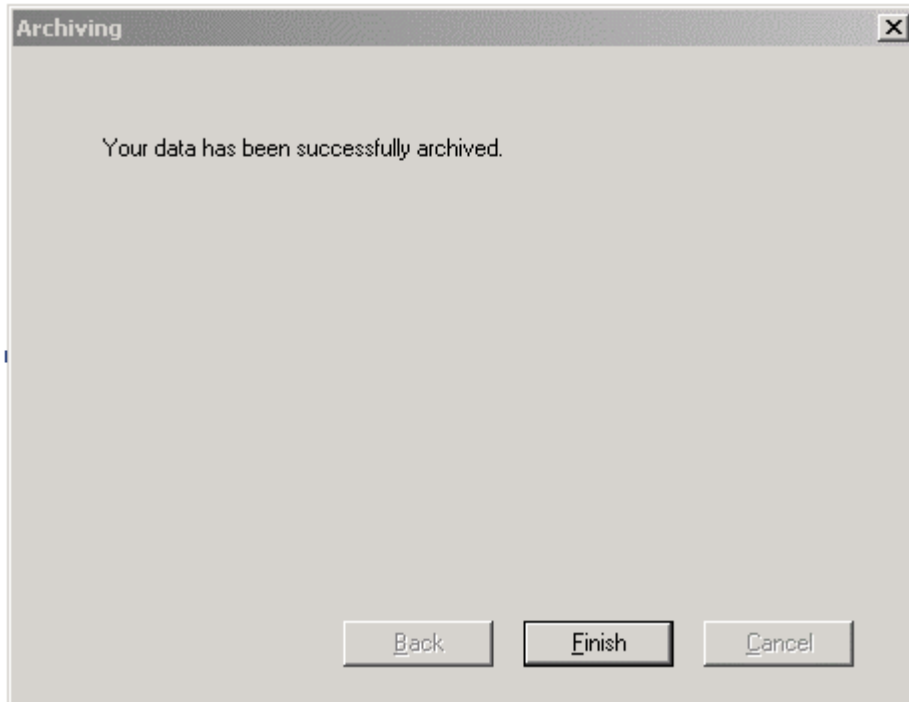

Archiving

Select location where you wish to store your archive.

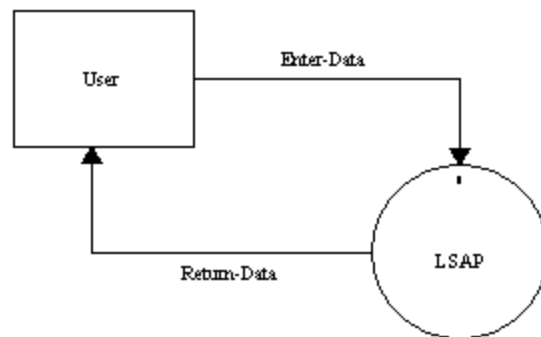

This dialog box, titled "Archiving", contains a close button (X) in the top right corner. The main text asks the user to "Select location where you wish to store your archive." Below this text is a file selection interface consisting of a single text input box and a "Browse" button. At the bottom of the dialog, there are three buttons: "Back", "Next", and "Cancel".

Section 4: Functional Requirements

Process 0: LSAP

The LSAP database will allow for a user to track the activities and tours of duty, in which EMS members have participated in throughout the course of a year. The software package will allow the user to work with the database through the use of interactive, standardized forms and reports. The main purpose of these forms is to derive the number of points acquired towards retirement benefits. This will be done through the use of calculations based on guidelines defined by the New York State Comptroller.

Process 1: Manage Duties

This process is designed to provide a way for the user to input duty logs into the LSAP database. The duty logs consist of the dates and duration that a specific member was on duty. It will also keep track of the calls a member responded to per month.

Process 2: Manage Activities

The Manage Activities process is engineered with the ability to enter activity information, on an individual basis or by the whole squad. Specifically, the activity information includes one of the seven predefined activities, the location of the activity, the date on which the activity occurred, and the duration of the activity.

Process 3: Generate Reports

This process provides the bulk of the work that this system is designed to accomplish. It allows the user to compose various reports based upon the various activities and duty log information. This process will also handle the majority of the calculations that pertain to retirement benefits.

Process 4: Manage Archive

This process is the systems' interface between the user, the database management system and the storage device. It allows the user to archive the current database to a specified storage device. Also, it will retrieve archived data that is requested when the user wishes to generate a report on information within that data.

Process 5: Authenticate

The authentication process secures the LSAP system from entry by unwanted users. This is accomplished by a system password entered by the user in order to grant access to the system. Along with access control, the authenticate process will keep a transaction log by tagging each transaction made with the initials that the user has entered upon logging into the system.

Process 6: Manage Profiles

This process is designed to let the user add, remove, edit or view a specific members' personal information. The fields of the profile will include the members' name, address, and contact number. This process will interact directly with the database system for storage or removal of information.

Section 5: Performance Requirements

The system must provide reliable tracking of tours of duty and member activity attendance. The security precautions taken are: logging on through the use of a system password and each transaction being tagged with the initials of the user. The response time of the system is dependant upon Microsoft Access' ability to retrieve and update information in the database.

Section 6: Exception Handling

The LSAP system should be flexible enough to handle any form of abnormal occurrences that might be encountered within the system constraints. Such occurrences may be:

1. Bad or erroneous data entered into fields. If there is an attempted to commit incorrect data into the system, it will be blocked by the field and require a valid selection to be made.
2. Archived data will be accessible for viewing but not editing. This information will be unchangeable because the comptroller has confirmed it, and editing within the system after confirmation would cause conflict between submitted data and company data.

Section 7: Early Subsets and Implementation Priorities

The system is required to provide certain functions in order to perform the tasks that it is designed to carry out. These functions can be defined as followed:

- Before the user has access to the system, it is required that they enter a system password for a security precaution.
- The system must allow the user to be able to create, remove, edit, and view all EMS member profiles.
- One of the two primary methods for inputting data into the system is presented as an activity entry form. This form must allow users to select an activity, its location, duration, and the members who attended it.
- The other primary method for data entry is a tour of duty form. This form will allow the user to select an EMS member, and enter the required field data as specified within the form.
- The system must be able to create and print reports in one of the specified formats.
- Finally, the system must be able to archive the data, which has been confirmed by the comptroller, into a storage device specified by the user.

Section 8:
Foreseeable Modification & Enhancements

There are some opportunities that can allow or require the enhancement of the software in the future. These opportunities include:

- 1) Electronic submission of squad annual reports to the New York State Comptroller.
- 2) Remote accessing of LSAP via the Internet.

Section 9: Acceptance Criteria

This software must be able to effectively perform a number of different functions to make usability simple and fast. The actual functioning of our product will be thoroughly tested and finalized with verification by LSAP. The criteria for this project are as follows:

- 1) The user(s) will log in with a single password that will be the same for all users, along with the user being required to enter their initials for identification purposes. Also, along with this, there will be a log kept tracking all transactions made by each user.
- 2) User must be able to enter activities within the specified categories, members who attended, a description of activity, location of the activity, and the duration of the activity in hours.
- 3) Software will check for conflicts and redundant information pertaining to the activities entered for each member that is already existing within the database.
- 4) A Tour of Duty record must also be kept within the database for each LSAP member.
- 5) Reports should be available in the form of an annual report, individual detailed report, individual summary report, and squad report.
- 6) The entire database will be archived to save on disk space. The archiving will take place on a storage device of the client's discretion, and will be archived by year. This information will be accessible at all times.

Section 10: Testing Requirements

- 1) The testing requirements phase of the project will consist of thoroughly testing all of the interfaces of the software. This will be the interface that exists between the user and the software, and then the interaction between the software and database.
- 2) The interaction between the user and our product will be done through interactions on a local PC. This will include a login attempt, which if is successful will allow the user access into the system. While inside the system, the user will have full access, allowing editing of the current database.
- 3) After each entry the program will update the fields of the database, and reports can be printed at that time if necessary.

Section 11: Design Hints and Guidelines

Every project has its limitations and guidelines it must follow. These limit but also narrow down our direction in the design process as the projects progresses. Some of these limitations and guidelines are stated as follows:

- The LSAP software package will be designed and maintained using Microsoft Visual C++, running on a Windows operating system.
- All data will be stored within a Microsoft Access database file.
- All design will be done in conjunction with the input from Dr. Timothy Lederman.
- The user will have an easy to follow interface for interacting with the system.

Section 12: Glossary

LSAP: (Length of Service Awards Program). Software package that tracks credits towards retirement benefits for volunteer EMS members.

MFC: (Microsoft Foundation Class). A software development tool used in conjunction with the C++ programming language, implemented within Microsoft Visual C++.

Microsoft Access: An application that provides simple management and versatility of small to medium sized data bases.

Microsoft Excel: An application that gives a user and efficient method of creating and editing spreadsheets.

Microsoft Visual C++: A software development tool that provides an efficient programming environment for the C++ programming language, and all libraries associated with it.

PC: (Personal Computer). A device that gives an individual many of the similar tools used on large and expensive network servers and mainframes.

Windows: A Microsoft product that provides a platform on which to run software and interact with peripheral hardware on personal computers.
