Client Meeting

11/4/2011

Prototyping-

The scope creep vs. bad idea bear

Scalability is a huge constraint

Test Scalability first or ASAP

10 judges 30 contestants

Auto refresh for the system? We do want that

Worried for teams compiling code at the same time.

Start with just two teams compiling at the same time.

Time Stamp than process

If we commit to a buffer than we are compiling one piece of code at a time

Try to possibly do parallel coding

All submissions should be into a database because of recovery. Robustness acquired.

Data Dictionaries – Go through some screens to figure out entities

Entities

Usernames, Passwords, Welcome Message, Style entities example: fonts, custom skins? (We need to change requirements user case and UML if we now have options for the system admin to change the skins) error message for username password and count of times a username or password as been incorrect. System administrator needs to be notified when login has dealt with certain amount of error.

System -

Username text box

Password textbox

Marco "knows somebody" for design

If a team submits code what place would they get into. Have the system calculate what place a team will get into if they submit their code within a time period. Time will be displayed for teams with each place that they can get into. Live ticker would be sick (Dr. Lim likes this idea).
