

## **Client Meeting #6**

10/3/2011

*For System Administrators:*

Would be configuring contest, choices and adding of languages, adding teams, using user names and passwords, etc.

*We must include some sort of spectator view:*

Spectators will be able to see scoreboard at any time during competition (this could be included under general users). Advisors like to have a copy of the problems for the competition. Problems should be given out to all spectators. Just have to make sure that spectator accounts cannot communicate with teams.

*Stress test: Requirements*

Nonfunctional: user-friendliness

Functional: scalability – will it work for one or 30 teams?

*Start thinking about making UML Activity diagram.* Has 'start' and 'stop' value, diamonds for decisions, etc. Use Smartdraw (currently on SE lab computer and computers in lab 306) in technology folder.

- This also includes diagrams for user case diagrams as well
- This is a part of the preliminary design
- Database system is inside our system so it must be included as non-human user
- We must think of what our system is running on (HostMonster? Oraserv?).

*At this point we have enough information to start to organize systems and problems before and during our system by drawing it in a basic flow chart.*

*As a team, we will start working on UML diagrams/Use Case Diagrams on Thursday as well.*

Used Case Diagrams are due and presented next Wednesday October 12<sup>th</sup>.
