Client Meeting
10/17/2011

We have to decide whether or not to separate our diagrams and models from our requirements specification document.

Activity Diagrams will be the next diagram we should be working on after Data Flow. They are similar to flow charts.

Use SmartDraw for the Data Flow diagram. Check in with Lim if available before diagrams are due this Friday.

Regarding exception handling – CACTUS should not crash if there are exception errors, such as null pointer. If including C++ or Python, there is different exception handling with these we must look in to. Infinite loops must be stopped within a certain time. Once again, system must be robust and if crashes, should be able to recover fairly well (have a save button or auto-save). Look to JOLT and their use with a temporary directory for compiling. What would happen if temporary directory is full? JOLT did not take this into account. Must decide how robust we can be.

Perhaps include pop-up on exit of our java window.

JDBC is connection between DBMS and webpage.
